

# Identification of associated transcription factors in promoters and their related enhancer regions

Cornelia Meckbach

Institute of Bioinformatics

March 8, 2018

- Transcription factors (TFs) on paired enhancer and promoter regions are associated if they are involved in the pairing process.
- ⇒ Identification of associated TFs on enhancer and related promoter regions based on their transcription factor binding sites (TFBSs).

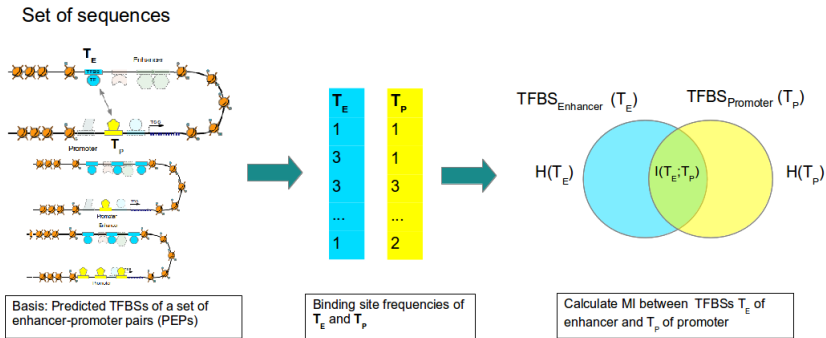

Inspired by:

Wong, KC (2017). **MotifHyades: expectation maximization for de novo DNA motif pair discovery on paired sequences.** Bioinformatics,

# Mutual information

- Identification of associated TFs of promoter-enhancer pairings (PEPs) using mutual information (MI)
- Two TFs are associated with each other if their binding behavior is in dependence of each other.

- Consider a set of experimentally validated PEPs for a cell line (e.g. by ChIA-PET)
  - Predict all TFBSs of the underlying sequences
  - Calculate MI for a TFBS pair  $T_E$  and  $T_P$

True PEPs (detected by ChIA-PET)

False PEPs (shuffled sequences)

- How much information contains TFBS  $T_E$  about  $T_P$  by considering the interaction type (label).

## Prediction of TFBSs using Match™

**True PEPs:** enhancer and promoter pairs (ChIA-PET)

**False PEPs:** shuffled enhancer and promoter sequences of positive samples

## Result

| TFBS Enhancer | TFBS Promoter | MI    |
|---------------|---------------|-------|
| $T_E 1$       | $T_P 1$       | 0.01  |
| $T_E 1$       | $T_P 2$       | 0.001 |
| ...           |               |       |

Normalize MI to avoid side effects

## Creation of joint TFBS-sequence matrix with label

|       | TFBSs of Enhancer |         |         | TFBSs of Promoter |         |         |       |
|-------|-------------------|---------|---------|-------------------|---------|---------|-------|
|       | $T_E 1$           | $T_E 2$ | $T_E 3$ | $T_P 1$           | $T_P 2$ | $T_P 3$ | Label |
| PEP 1 | $f_{1,1}$         |         |         |                   |         |         | $l_1$ |
| PEP 2 |                   |         |         |                   |         |         |       |
| ...   |                   |         |         |                   |         |         |       |
| PEP N | $f_{N,1}$         |         |         |                   |         |         | $l_N$ |

$f_{i,j}$  is the number of TFBS  $j$  in sequence  $i$   
 $l_i$  is the label of PEP  $i$  (true/false pairing)

## Normalization and interval building of TFBS count values

$I(T_E 1; T_P 1; L)$

|       | $T_E 1$   | $T_E 2$ | $T_E 3$ | $T_P 1$ | $T_P 2$ | $T_P 3$ | Label |
|-------|-----------|---------|---------|---------|---------|---------|-------|
| PEI 1 | $i_{1,1}$ |         |         |         |         |         | $l_1$ |
| PEI 2 |           |         |         |         |         |         |       |
| ...   |           |         |         |         |         |         |       |
| PEI N | $i_{N,1}$ |         |         |         |         |         | $l_N$ |

$i_{i,j}$  is the interval of count value of TFBS  $j$  in sequence  $i$   
 $l_i$  is the label of PEP  $i$  (true/false pairing)

- Workflow to detect associated TFs on enhancer and promoter regions based on their binding sites
- Compared four different information theoretic measures on synthetic data sets
- Multivariate mutual information  $I(T_E; T_P; L)$  performs best on both sets
